m-Fin accepts old non-standard project id's [1]

September 8, 2016 by Carl Sorenson [2]

m-Fin now accepts project id's that were set up before CU's current specification for id's.

When you type a project id into a text box prompt m-Fin checks that what you've typed conforms to CU's specification for project id's: seven characters all digits except possibly a capital letter in the third position. There are a few project id's in use, however, that do not conform to this specification because they pre-date it. m-Fin now specifically accepts them. Previously if you wanted to run for one of these project id's you had to determine its speedtype and run for that instead.
