Terminal Servers [1]

This section is specific to System Administration server services.

Terminal servers are used to provide the CU System Administration office a common connection point for administering resources through unified servers to collaborate and store important files securely.

Almost all CU System employees have access to certain servers. However, some may require special access.

Campus OIT maintains their own servers for various campus-level resources. Please reference your campus OIT resources for more information.

Request access

To request access to a terminal server, please email the UIS Identity and Access Management [2] team and provide the specific server and your CU System ID account name.

In order to have access to System Administration servers, you must have a CU System ID.

Common users

System terminal servers are only available to employees with a CU System ID.
