

Secure File Transfer Protocol ^[1]

CU's Secure File Transfer Protocol (SFTP) ^[2] is used by customers to upload files for batch processing and to provide short-term storage to aid in collaboration between staff and vendors.

Server access enables users to upload or download files for processes where a filepath is specified in a run control. This resource is limited to employees and vendors with a business need to securely transfer files with CU-SIS Campus Solutions processes.

Benefits of SFTP:

- 24/7 file transfer services capabilities
- Centralized location for short-term file storage
- Secure file transfer for campuses, customers and vendors
- Validates and authorizes files uploaded for batch processing and storage

Request access

To request access, fill out the [SFTP Access Request Form](#) ^[3].

CU-SIS SFTP Server access will require approvals from CU-SIS application managers and is dependent on a CU System ID for access.

Common users

University staff members or vendors with a business need.

Groups audience:

University Information Services
